

Planet Team Plan

Who builds what, the plan for Monday to Thursday, and how to use Git on your task. Read it alongside the Planet Project Guide.

Munirat captain **Wale** vice captain

Together they build the template, review and merge every pull request, and deploy the site.

Who does what

In every pair, the HTML person goes first. The CSS person starts once the HTML is merged.

1	Header + dark mode Logo and the DARK / LIGHT button that switches the colours. HTML · CSS · JS	VictorHTML + CSS Aisha dark mode JS	Medium ●●○
2	Search bar Input and Search button, with hover, focus and "No results" styles. HTML · CSS	AyobamiHTML + CSS	Starter ●○○
3	Planet card Picture, name, type, description, stats and facts, with Earth as the example. HTML · CSS	UyaiHTML AfeezCSS	Medium ●●○
4	Facts table Heading, text and the grouped table. It must fit on a phone. HTML · CSS · RESPONSIVE	HamidaHTML VictoriaCSS + phone layout Munirathelps + reviews	Medium ●●○
5	Footer About with everyone's first names, plus the Amaka N, group and TSAcademy links. HTML · CSS	AdanniaHTML TeddyCSS	Starter ●○○
6	Planet search (API) Gets the planet you typed from the API and fills in the card. JAVASCRIPT · FETCH	Quduswrites it Waleguides	Harder ●●●
7	Testing + README Checks the live site on phone, tablet and desktop in both themes, and writes who built what. TESTING · MARKDOWN	Asimaufrom 10 Oct	Starter ●○○

Stuck, or want to swap? Say so in the group chat. You can ask for help any time.

Monday to Thursday

One kind of work each day. Everyone is finished by Thursday night, and the rest of the time is for small fixes.

Monday

5 Oct

SET UP + HTML

Everyone is set up, and every section exists in HTML.

- **Everyone, first thing:** do "Your first time" (page 3). Your first pull request adds your name and GitHub link to the README.
- **Victor, Ayobami, Uyai, Hamida, Adannia:** write your section's HTML inside your space in `index.html`.
- **Qudus + Wale:** fetch the API and print the planet data in the console.

Push any time → we merge at 5pm and 9pm

Tuesday

6 Oct

CSS DAY

The page looks like the Figma, in light mode on desktop.

- **Victor, Ayobami, Afeez, Victoria, Teddy:** pull main first (to get the HTML), then style your section in your own CSS file.
- **Qudus + Wale:** show Earth's data in the planet card.

Push any time → we merge at 5pm and 9pm

Wednesday

7 Oct

JS + PHONE

Everything works, in dark mode and on phones too.

- **Aisha:** the DARK / LIGHT button. **Qudus:** search for any planet, and show "No results" when nothing matches.
- **All CSS people:** check your section at phone width and in dark mode, then fix it in a new pull request.

Push any time → we merge at 5pm and 9pm

Thursday

8 Oct

FINISH

Everyone is finished. The site is online and the README is done.

- **Everyone:** test the whole page (light and dark, phone, tablet, desktop). Post anything broken in the chat and fix it the same day.
- **Wale:** deploy on Netlify. **Munirat:** finish the README with the live link.

Last merge at 9pm → live link in the group chat

9–19 Oct

Fri → Mon

SPARE TIME

Small fixes only. Everyone submits on Monday 19 October.

- **Asimau** joins on the 10th to test the live site and finish the README.

Push any time

Open your pull request whenever your task is ready.

We merge at 5pm and 9pm

Munirat or Wale reviews and merges every day.

Coding call, 8–9pm

Work together and ask questions live.

Before Monday: send Wale your GitHub username and accept the invite email from GitHub. Munirat and Wale will push the template and post the repo link in the group chat.

Your first time (Monday morning)

Do these 5 steps once, in order, on Monday morning. After that you never need them again.

1 Make a folder ON YOUR DESKTOP

Right-click on your Desktop, choose **New** → **Folder**, and name it `planet`. Leave it empty.

2 Open the folder in VS Code IN VS CODE

Open VS Code. Click **File** → **Open Folder**, choose the `planet` folder on your Desktop, and click **Select Folder**.

3 Open the terminal IN VS CODE

At the top, click **Terminal** → **New Terminal**. A box opens at the bottom of the screen. That's the terminal, where you type the Git commands. It's already inside your `planet` folder.

4 Download the project IN THE TERMINAL

```
git init -b main
git remote add origin https://github.com/OUR-GROUP/planet.git
git pull origin main
```

`git init` makes your folder a Git folder. `git remote add origin` links it to the team project on GitHub. `git pull` downloads the project into your folder. Munirat will post the real link in the group chat.

5 Tell Git your name IN THE TERMINAL

```
git config user.name "Victor"
git config user.email "the email you use on GitHub"
```

Then your work shows up under your name. That matters because you're marked on your own work.

The one naming rule for classes

Header

header-logo
header-toggle

Search

search-input
search-button

Card

card-image
card-name

Table

facts-title
facts-table

Footer

footer-about
footer-link

✓ `.card-name { }` ✗ `.name { }` ✗ `h1 { }` ✓ `color: var(--color-text);` ✗ `color: #2b3442;`

Hover or focus? Add it to the same class: `.search-button:hover`. Every CSS file lists its class names and colours at the top, so you don't have to remember them.

Every task, step by step

Do these steps every time you start a task, in your `planet` folder in VS Code. Here, Victor is building the header HTML on Monday.

1 Go to your branch IN THE TERMINAL

Starting a NEW task

```
git checkout main
git pull origin main
git checkout -b header-html-victor
```

Carrying on the SAME task

```
git checkout header-html-victor
git pull --no-edit origin main
```

A new task always starts from main, so it gets the team's newest work. `-b` creates the branch, so only use it once per task. Your branch names are on the **Branch Names** sheet.

2 Write your code IN VS CODE + BROWSER

HTML: open `index.html`, find your section's space (`HEADER` ... `END HEADER`), and write only between those lines.
CSS: write only in your own file, like `css/header.css`. Save (Ctrl + S) and check it in the browser.

3 Check what you changed IN THE TERMINAL

```
git status
```

This lists the files you changed. Only your own files should be there. If you see anyone else's, ask before going on.

4 Save a snapshot IN THE TERMINAL

```
git add .
git commit -m "header: add header HTML"
```

`add` picks your changes. `commit` saves them, with a short message saying what you did.

5 Send it to GitHub IN THE TERMINAL

```
git push -u origin header-html-victor
```

This uploads your branch. You can push any time of day.

6 Ask for it to be added ON THE GITHUB WEBSITE

Pushing doesn't do this for you. On the GitHub page, click the yellow **Compare & pull request** button, say what you built, then click **Create pull request**.

7 Wait for 5pm or 9pm GITHUB, THEN TERMINAL

Munirat or Wale checks it. Either it's **merged** (done!), or you get a comment asking for a change. To fix it, make the change on your branch, then run `git add .`, `git commit -m "header: fix logo size"` and `git push`. The open pull request updates by itself.

8 Next task? Back to step 1 IN THE TERMINAL

Use "Starting a NEW task". On Tuesday, Victor runs `git checkout main`, `git pull origin main`, then `git checkout -b header-css-victor`.

Remember: never push to main, and never merge your own pull request. Pull before you start. Only touch your own section and your own CSS file.
